

What is new in Transcription?...

Transcription AID 4 is a major update of the five-year-old application already well established throughout Europe. Some of its substantial improvements include:

1. More streamlined, elegant, and easy to use interface, very similar to Microsoft Word...
2. Supports a proprietary “plug-and-play” foot pedal to work faster.
3. Transcribes recordings made with virtually any digital recorder, PDA, MP3 player and Smartphone.
4. Batch Transcription Module. Unattended sound format conversion and transcription of numerous voice recordings from multiple dictating authors in the background.
5. One single click to easily transcribe either an individual recording or access the Batch Transcription module.
6. New “Quick Correct” correction method. Much faster correction and improvement of the Speech files, directly in the main screen of the application.
7. New “Phonetic Checker”. Unlike conventional spellcheckers, it automatically spots the most probable acoustic mistakes made by the speech engine. Allows the typist to quickly jump to them without playing back the entire transcription.
8. Ability to change the default folders for saving and opening transcriptions, allowing organizations to adjust the software for the way they want or prefer to work.
9. Saves transcriptions in PDF format
10. The application has been rewritten to guarantee future developments under Windows Vista.

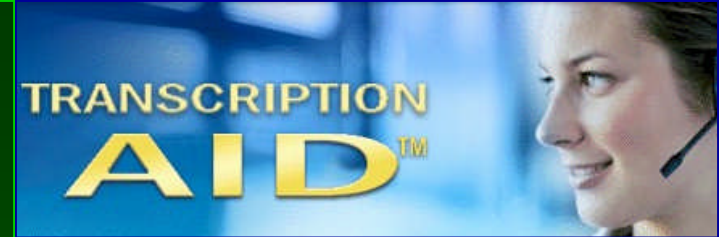

There are many more features of Transcription AID:

The key to unlocking NaturallySpeaking's efficiency and cost saving transcription potential!

With Transcription AID, simply dictate into a digital recording device or PC **and forget about having to correct anything!**

- NaturallySpeaking will automatically transcribe the author's dictation
- The typist will correct the transcription, **improving the Author's profile in the process for further accuracy!**

Perfect documents and Speech files —for maximum accuracy, without any correction and effort!

Transcription AID is a revolutionary application bundled with a traditional style transcriptionists' foot pedal.

Transcription AID greatly simplifies, expands and enhances the capabilities of

Dragon NaturallySpeaking —the world leading speech recognition engine.

Transcription AID & Dragon

After years of research and development, speech recognition has finally come of age. Today, anyone with good dictation habits can get impressive results, up to 98% accuracy or better.

For this to happen, NaturallySpeaking users (authors) would have to make corrections to the automatic transcription (documents) themselves. This is quite time consuming and uncomfortable for many busy professionals. Hence, the crucial step of improving the author's profile simply does not happen in most cases...

Transcription AID, the first application of its kind, solves this problem. Playing back the synchronized original voice recording (dictation) while reading the transcription, by pressing a proprietary foot pedal, any typist is able to easily make corrections and improve the voice profile at the same time —this is just like a traditional transcription machine with all the advantages of digital!

- **Dictate anywhere and into virtually any digital dictation device**

Dictate from any location using a handheld digital recorder, PDA, Smartphone, or even MP3 with voice recording. You can also dictate directly into your desktop PC or laptop.

- **Perfect synchronization of voice recording and transcription**

Playing the voice recording (dictation) while simultaneously reading the automatic transcription greatly facilitates the correction process, allowing for simple comparison between sound and text. No more tape or “cassette” rewind to find the right spot!

- **No “Playback Dropout” allows for instructions to the typist**

Typists can safely correct and edit transcriptions with no damage to the original voice recordings. The unmodified recording file is preserved as an archival record. This unique technology also allows the author to insert procedural or formatting instructions to the typist, anywhere within the dictation.

- **Simple, easy to use interface**

The intuitive interface, similar to Microsoft Word, reduces learning time for the typist and allows advanced formatting including unlimited number of “Undo” & “Redo” operations; tab settings and paragraph indents.

- **Encrypt, pack & e-mail transcription for revision**

The author (and typist) can encrypt, pack, compress, and send through a network or e-mail the transcription and voice recording together for revision —all with a single click!

With Transcription AID, the burden of making corrections in the automatically transcribed text is transferred from the author to the typist:

Workflow - Authors

1. Dictate
2. Save the dictation
3. Send the dictation to the typist

The author's work is finished!

Workflow - Typists

1. **Open either the voice recording (or the transcription)**
NaturallySpeaking automatically transcribes the author's recording in the former case.
2. **Make corrections**
The typist simply reads the transcription. Whenever an illogical word or phrase occurs, a quick press of the foot pedal (function key or mouse click) enables the typist to hear the author in perfect synchronization with the transcription. In this way, the typist can easily correct and improve the author's speech profile.
3. **Save the corrected document**
The corrected and edited document is sent

Transcription AID is so intuitive, fast and easy to use, it will quickly win the heart of any typist.

Concentrate in what you are good at (dictation) and work in a much more productive and comfortable way!...
